HoneyDo

HoneyDo is a two person, database driven task manager. It takes the typical “honey do list” to a whole new level by implementing not only technology but rewards! The app is designed for use by two people, regardless of gender, involved in a relationship; for our example we will use a husband/wife relationship.

HoneyDo will work by having the couple register together. Once registered the wife will set up her list of tasks that need completion, assigning “Brownie Points” to each task, and a list of rewards available (to be bought with Brownie Points.) these tasks will be viewable by the both the husband and wife. Once the husband completes one of the assigned tasks, the “Brownie Points” will be deposited in his “bank”, after the husband as accumulated enough Brownie Points he will be able to redeem them for one of the rewards specified by the wife.

The utility of this application is in its ability to help strengthen relationships. Anyone in a relationship can use this app in a way they best see fit. Household chores will get done faster, football games will go uninterrupted, and the world will be a happier place.

Design Process

- Complete Landing Page - (done, needs CSS)
- Start App - (Completed by Sept 3)

Technologies Used:

Front End

- HTML, CSS, Bootstrap
- AngularJS

Back End

- mySQL
- ORM

New Tech

- AngularJS
- Socket io

User Auth

- TBD
